

Phase 1 results

Abstract

The main objective of this phase is to help farmers to calculate the suitable amount for watering plants within a certain location and area in a specific month. This calculation will help farmers to reduce watering with an optimal amount which results in low spending money.

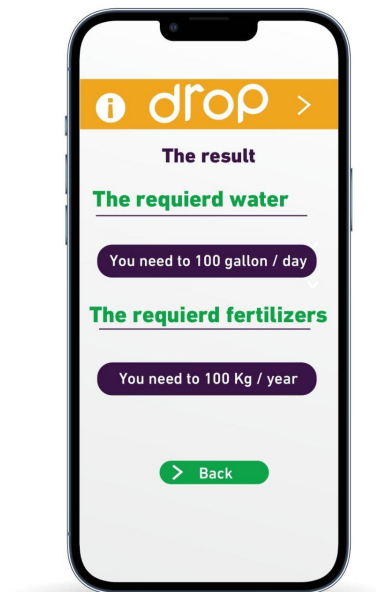

Results

- In this page, the user specifies the plant data which are the plant category, plant type and the quantity of the plant that is wanted to be irrigated. Then the location of the plant will be determined and the month. These input data that are required to calculate the required watering amount.
